INTRODUCTION

FOREWORD
These Troubleshooting and Repair Instructions are applicable to the heaters listed on the title page, to the exclusion of all liability claims.
Depending on the version or revised status of the heater, there may be differences between it and these trouble-shooting and repair instructions.
The user must check this before carrying out the repair work and, if necessary, take the differences into account.

SPECIAL TEXT STRUCTURE, PRESENTATION AND PICTURE SYMBOLS

Special text formats and picture symbols are used in these instructions to emphasise different situations and subjects.
Please refer to the following examples for their meanings and appropriate action.

SPECIAL TEXT FORMATS AND PRESENTATIONS

• This dot (•) indicates a list, which is started by a heading.
  – If an indented dash (–) follows a "dot", this list is a subsection of the black dot.

PICTURES SYMBOLS

⚠️ DANGER!
This information points out a potential serious or fatal danger.
Ignoring this information can result in severe injuries.
➡️ This arrow indicates the appropriate precaution to take to avert the danger.

⚠️ CAUTION!
This information points out a dangerous situation for a person and / or the product. Failure to comply with these instructions can result in injuries to people and / or damage to machinery.
➡️ This arrow indicates the appropriate precaution to take to avert the danger.

 PLEASE NOTE!
These remarks contain recommendations for use and useful tips for the operation, installation and repair of the heater.

SAFETY INSTRUCTIONS FOR INSTALLATION AND REPAIR

⚠️ CAUTION!
Improper installation or repair of Espar heaters can cause a fire or toxic exhaust entering the inside of the vehicle.
This can cause serious and even fatal risks.
➡️ The heater may only be installed according to the specifications in the technical documents or repaired using original spare parts by authorised and trained persons.
➡️ Installation and repairs by unauthorised and untrained persons, repairs using non-original spare parts and without the technical documents required for installation and repair are dangerous and therefore are not permitted.
➡️ A repair may only be carried out in connection with the respective unit-related technical description, installation instructions, operating instructions and maintenance instructions.
This document must be carefully read through before / during installation and repair and followed throughout.
Particular attention is to be paid to the official regulations, the safety instructions and the general information.

 PLEASE NOTE!
• The relevant rules of sound engineering practice and any information provided by the vehicle manufacturer are to be observed during the installation and repair.
• When carrying out electric welding on the vehicle, the positive cable at the battery should be disconnected and placed at ground to protect the ECU.

LIABILITY CLAIM / GUARANTEE

Espar does not accept any liability for defects and damage, which are due to installation or repair by unauthorised and untrained persons.
Compliance with the official regulations and the safety instructions is prerequisite for liability claims.
Failure to comply with the official regulations and safety instructions leads to exclusion of any liability of the heater manufacturer.
1 INTRODUCTION

ACCIDENT PREVENTION

General accident prevention regulations and the corresponding workshop and operating safety instructions are to be observed.

INITIAL START-UP OF THE HEATER OR FUNCTIONAL TEST AFTER A REPAIR

• After installation or carrying out a repair on the heater, the coolant circuit and the whole fuel supply system must be vented carefully.
• Comply with the instructions issued by the vehicle manufacturer.
• During the heater trial run, all water and fuel connections must be checked for leaks and secure, tight fit.
• If faults occur while the heater is running, use a diagnostic unit to correct the cause of the fault.

WARNING TO INSTALLER!

Correct installation of this heater is necessary to ensure safe and proper operation.
Read and understand this manual before attempting to install the heater. Failure to follow all these instructions could cause serious or fatal injury.
• Disconnect the vehicle battery before starting any kind of work.
• Before working on the heater, switch the heater off and let all hot parts cool down.
• The heater must not be operated in closed areas, e.g. a garage or in a multi-storey parkade.

The heater must not be mounted in the passenger compartment of vehicles. However, a heater in a hermetically sealed enclosure which also complies with the aforementioned conditions may be used.

All appropriate precautions must be taken when arranging the heater to minimize the risk of injuries to people or damage property.
Parts related to the fuel system must not be located in the passenger compartment.

WARNING - EXPLOSION HAZARD!

• Heater must be turned off while re-fueling.
• Do not install heater in enclosed areas where combustible fumes may be present.

A warning sign is to be fixed to the intake connection indicating that the heater must be switched off before refuelling.

WARNING - FIRE HAZARD!

• Install the exhaust system so it will maintain a minimum distance of 50mm (2") from any flammable or heat sensitive material.
• Ensure that the fuel system is intact and there are no leaks.

The heater must not pose a fire hazard. This requirement is deemed to be fulfilled if adequate clearance is ensured for all parts during installation, sufficient ventilation is provided and fireproof materials or heat shields are used.

PLEASE NOTE!

DIAGNOSTIC COMPATIBILITY

Only EDITH and EasyStart diagnostic products are compatible with Hydronic II heaters. Older diagnostic products like the 7day timer, Digi Diagnostic and “Fault code retrieval device” are not compatible.

EMERGENCY SHUTDOWN — EMERGENCY OFF

If an emergency shutdown – EMERGENCY OFF – is necessary during operation, proceed as follows:
• Switch the heater off at the control element or
• remove the fuse or
• disconnect the heater from the battery.
1 INTRODUCTION

⚠️ WARNING - ASPHYXIATION HAZARD!

- Route the heater exhaust so that exhaust fumes cannot enter any passenger compartments.
- If running exhaust components through an enclosed compartment, ensure that it is vented to the outside.

The air for the heater's combustion chamber must not be sucked in from the vehicle's passenger compartment.

⚠️ WARNING - SAFETY HAZARD ON COOLANT HEATERS USED WITH IMPROPER ANTIFREEZE MIXTURES!

- The use of Espar coolant heaters requires that the coolant in the system to be heated contains a proper mixture of water and antifreeze to prevent coolant from freezing or slushing.
- If the coolant becomes slushy or frozen, the heater's coolant pump cannot move the coolant causing a blockage of the circulating system.
- This situation could cause engine damage and/or personal injury. Extreme care should be taken to ensure a proper mixture of water and antifreeze is used in the coolant system.
- Refer to the engine manufacturer for coolant recommendations requirements.

⚠️ SAFETY INSTRUCTIONS FOR APPLICATION AND PROPER PURPOSE!

The heater must only be used and operated for the range of application stated by the manufacturer in compliance with the "Operating instructions" included with every heater.

The factory nameplate or duplicate must be affixed so that it can still be easily read when the heater is installed in the vehicle.

⚠️ ATTENTION!

Operation with bio-diesel HYDRONIC II D5 is not certified for use with bio-diesel. Admixtures of bio-diesel up to a magnitude of approx. 10% are allowed.

⚠️ ATTENTION!

Heating at high altitudes.
- Up to 1500 meters (4920') - unrestricted heating operation is possible.
- Above 1500 meters (4920') - heating operation is in principle possible for short periods, e.g. when crossing a mountain pass or during a brief stop. In cases of extended stays, the fuel supply at the fuel metering pump has to be adapted to high altitude conditions.

P/N: 22 1000 33 22 00 is the high altitude device used with the Hydronic II.

⚠️ ATTENTION!

Disposal of materials
Old devices, defective components and packaging material can all be separated and sorted, so that all parts can be disposed of as required in an environmentally friendly manner and recycled when possible.
Electric motors, control boxes and sensors (e.g. temperature sensors) are deemed to be “electronic scrap”.

If no limit values are given, the technical data listed is with the usual heater tolerances of ± 10 % at nominal voltage and 800 ft altitude.

CAUTION!

Operating the water pump outside the specified technical data can cause malfunctions.

The technical data must be complied with at all times.
4 INSTALLATION PROCEDURES

PRINCIPAL DIMENSIONS - BOXED VERSION

HEATER LOCATION
Always mount the heater in a protected area. Eg: storage compartment, engine compartments, step box or battery box. Espar recommends you use the boxed unit.

When mounting the heater adhere to the following conditions:
• Situate the heater below the normal coolant level of the engine.
• Guard against excessive road spray.
• Keep coolant hoses, fuel lines and electrical wiring as short as possible.

BOX STUD DIMENSIONS

HEATER MOUNTING
If your heater is boxed it must be mounted level with the exhaust pointing towards the ground. If your heater is not boxed follow the mounting instructions for the heater and the water pump on the following pages.

The heater must not pose a fire hazard.
– This requirement is deemed to be fulfilled when adequate clearance to all parts is observed during installation, sufficient ventilation is provided and fireproof materials or heat plates are used.

The heater must not be located in the passenger compartment.
A unit may however be used in a hermetically sealed housing which also corresponds to the conditions stated above.
The factory nameplate or duplicate must be affixed so that it can still be easily read when the heater is installed in the vehicle.
All appropriate precautions must be taken when arranging the heater to minimise the risk of injuries to people or damage property.

⚠️ DANGER — RISK OF INJURIES AND BURNS!
The coolant and components of the coolant circuit get very hot.
• Parts conveying water must be routed and fastened in such a way that they pose no temperature risk to people, animals or material sensitive to temperature from radiation / direct contact.
• Before working on the cooling water circuit, switch the heater off and wait until all the components have cooled down completely, if necessary wear protective gloves.

PLEASE NOTE!
Do not install the water pump at the lowest point in the water circuit, otherwise the particles in the water circuit settle in the water pump. A water filter must be used if the cooling water is highly soiled/contaminated with particles.

⚠️ CAUTION!
Protect the heater from excessive road spray to avoid internal corrosion.

PLEASE NOTE!
The installation position of the water pump with the pump head facing downwards is not advantageous for automatic venting.
– The water pump can be installed in any position.
– The water inlet must be designed so that it is always completely filled with water (the water pump is not selfpriming).
4 INSTALLATION PROCEDURES

PERMISSIBLE INSTALLATION POSITIONS

The heater and the water pump should preferably be installed in the normal position. Depending on the installation conditions, the heater can be installed within the permissible ranges shown below.

INSTALLATION POSITION WITH ALLOWABLE SWIVEL RANGES

Heater in horizontal installation position (normal position*) with permissible swivel range up to the vertical installation position. All installation positions between 0° and 90° are permitted.

Heater upright in horizontal installation position (normal position*) with permissible swivel range up to the horizontal installation position. All installation positions between 0° and 90° are permitted.

Please note!
If a heater is swivelled out of the normal position, the fuel connections must always be at the bottom.

WATER PUMP MOUNTING

Mount the water pump bracket to the heater as shown in the examples below. (torque 6+2 Nm ~ 4.4 ft-lb) or in a suitable position within the vehicle, depending on the installation conditions. Then insert the water pump in the rubber mount and press in until the water pump is locked into position.
4 INSTALLATION PROCEDURES

WATER PUMP LOCATION AND MOUNTING

The water pump bracket included in the installation kit must be fixed to the heater (see installation examples below) or in a suitable position in the vehicle, depending on the installation conditions. Then insert the water pump in the rubber element and press in until the water pump has latched into position.

INSTALLATION EXAMPLES

Heater with angled water inlet connection. The water pump is fixed to the bottom of the heater, on the "fuel connection" side. The water discharge connection of the water pump faces to the side.

Heater with angled water inlet connection. The water pump is fixed to the bottom of the heater, on the "water outlet connection" side. The water discharge connection of the water pump faces to the side.

The water pump is fixed to the "fuel connection" side of the heater with rising water inlet connection. The water discharge connection of the water pump faces upwards.

The water pump is fixed to the "water outlet connection" side of the heater with rising water inlet connection. The water discharge connection of the water pump faces upwards.

The water pump is fixed to the "fuel connection" side of the heater with the water inlet connection facing downwards. The water discharge connection of the water pump faces upwards.

The water pump is fixed to the "water discharge connection" side of the heater with the water inlet connection facing downwards. The water discharge connection of the water pump faces upwards.
4 INSTALLATION PROCEDURES

HEATER BRACKET INSTALLATION
Use the bracket included in the installation kit to fix the heater in a suitable position on the vehicle.

INSTALLATION STEPS

1. Improper installation or repair of Espar heaters can cause a fire or toxic exhaust entering the inside of the vehicle.

   Mount with 3 screws or fixing with 4 screws.

2. Mount special screw M6 x 17 onto the heater.

   Mount special screw M6 x 17 (with adhesive coating) on heater on the fuel connection side (left-hand Fig.) or on the water discharge connection side (right-hand Fig.) (tightening torque 6+2 Nm ~ 4.4 ft-lb).

3. Hook heater into the bracket.

4. Use 2 hexagon screws M6 x 12 (with adhesive coating) to fix heater to the bracket (tightening torque 6+2 Nm ~ 4.4 ft-lb).
Please note!

- When installing the heater and the water pump, please note the direction of flow of the cooling water circuit.
- Fill the heater and water hose with coolant before connecting to the coolant circuit.
- Route the water hoses without any kinks, and in a rising position if possible.
- When routing the water pipes, maintain sufficient clearance from hot vehicle parts.
- Protect all water hoses / water pipes from chafing and from extreme temperatures.
- Secure all hose connections with hose clips (tightening torque: 3+0.5 Nm ~ 2.2 ft-lb).
- Re-tighten the hose clips after the vehicle has been running for 2 hours or has travelled 100 km.
- The minimum water flow rate is only guaranteed if the temperature difference of the heating medium does not exceed 10°C (18°F) between water inlet and water outlet during heating.
- Only overpressure valves with an opening pressure of min. 0.4 – max. 2 bar (5.8 - 30 psi) may be used in the cooling water circuit.
- As corrosion protection the cooling water must contain at least 10 % coolant (anti-freeze).
- During cold periods the coolant water must contain sufficient coolant (antifreeze).
- Before commissioning the heater for the first time or after changing the cooling water, the whole cooling water circuit including the heater must be vented without bubbles according to the vehicle manufacturer’s instructions.
- Only top up with coolant approved by the vehicle manufacturer.
Take the coolant from a low point on the engine to reduce aeration in the system.

Ensure proper direction of coolant flow by taking coolant from a high pressure point in the engine and returning it to a low pressure point. (ie. pickup from back of block and return to the suction side of the engine's water pump).

Ensure adequate flow rate through the heater by comparing the incoming and outgoing coolant temperatures while the heater is running. If the rise in temperature exceeds 10°C (18°F), coolant flow must be increased by modifying the plumbing.

If a bunk heat exchanger is incorporated into the system, proper plumbing layouts must be followed.

⚠️ CAUTION!
It is possible for the coolant and components of the coolant circuit to get very hot.
4 INSTALLATION PROCEDURES

FUEL SUPPLY

PREFERRED FUEL EXTRACTION — IN GASOLINE OR DIESEL VEHICLES

1 Fuel pick-up pipe = Ø 2 mm
2 Adapter, Ø 5.0 / 3.5 mm
3 Fuel metering pump
4 Fuel filter – (optional)
5 Plastic fuel line, Ø 2 mm, Espar black or blue line recommended
6 Plastic fuel line, Ø 2 mm
7 Rubber fuel line Ø 3.5 mm
8 Elbow, 105°

CAUTION!
Safety instructions for the fuel supply!
➔ The fuel must not be discharged by means of gravity or overpressure in the fuel tank.

MAXIMUM FUEL LINE LENGTHS
Intake side
\[a = 2 \text{ m (6.5')}\]
Pressure side
\[b = 6 \text{ m (19.5')}\]
4 INSTALLATION PROCEDURES

INSTALLATION POSITION OF THE METERING PUMP
Always install the metering pump with the delivery side rising upwards.
Any mounting position over 15° is allowed, although a mounting position between 15° and 35° is preferable.

MAXIMUM SUCTION AND PRESSURE HEAD OF THE METERING PUMP
Pressure head from fuel tank to metering pump:
\[ a = 3000 \text{ mm (9.8')} \]
\[ b = 1000 \text{ mm (3.2')} \text{ (gasoline = 500 mm (1.6'))} \]

Suction head in a fuel tank in which negative pressure to 0.03 bar (0.4 psi):
\[ b = 400 \text{ mm for diesel (1.3')} \text{ (gasoline = 150mm (0.5'))} \]
Pressure head from the fuel metering pump to the heater:
\[ c = 2000 \text{ mm (6.6')} \]

PLEASE NOTE!
Check tank ventilation.

CAUTION!
SAFETY INSTRUCTIONS FOR INSTALLING THE METERING PUMP!
Always install the metering pump with the delivery side rising upwards – minimum angle 15°.
Protect the metering pump and filter from impermissible heating, do not install close to silencers and exhaust pipes.
4 INSTALLATION PROCEDURES

**FUEL PICK-UP PIPE INSTALLATION (DRILL OPTION)**

- Choose a protected mounting location close to the pump and heater. A spare fuel sender gauge plate provides an ideal mounting location. If one is not available...
- Drill mounting holes in tank to accommodate pick-up pipe as shown.
- Tighten Ferrule nut to pick-up pipe at desired height.
- Cut the fuel pick-up pipe to length. Allow 2-2.5" from bottom of tank.
- Mount the fuel pick-up pipe as shown.
- Lower the fuel pick-up pipe (with reinforcing washer) into the tank using the slot created by the two 0.6cm (1/4") holes.
- Lift the assembly into position through the 2.5cm (1") hole.
- Assemble the rubber washer, metal cup washer and nut.

**PLEASE NOTE!**

Some pick-up pipes can be installed by either drill or NPT.
4 INSTALLATION PROCEDURES

FUEL SUPPLY

FUEL QUALITY FOR DIESEL HEATERS

- The heater runs problem-free on standard grade diesel fuel.
- Always use fuel that is appropriate for the temperature that the heater is being used in.

At external temperatures of 0 °C to –20 °C, use Winter diesel (32 °F to –4 °F)
At external temperatures of –20 °C to –40 °C, use Arctic diesel or polar diesel (–4 °F to –40 °F).

OPERATION WITH BIODIESEL

HYDRONIC II D5 is not certified for use with bio-diesel.
Admixtures of bio-diesel up to a magnitude of approx. 10%.

PLEASE NOTE!

- Additions of used oil are not allowed!
- After refuelling with winter or cold diesel, the fuel pipes and the metering pump must be filled with the new fuel by letting the heater run for 15 minutes!
- Quaility of fuel will vary from manufacturer and location.
- Use of fuel additives may result in adverse effects.
4 INSTALLATION PROCEDURES

EXHAUST CONNECTION

The exhaust system consists of a Ø 24mm flexible exhaust pipe. An optional exhaust silencer is available.

- Connect the exhaust pipe to the exhaust port on the heater and attach with clamp provided. (tightening torque: 7+0,5 Nm ~ 5 ft-lb)
- Run exhaust to an open area to the rear or side of the vehicle so that fumes can not build up and enter the passenger compartment or the heater combustion air intake. Insure that the pipe is fastened securly. Observe warnings stated in this section and through out the manual.
- Install exhaust pipe with a slight slope or drill a small hole in the lowest point to allow water to run out. Any restriction in exhaust will cause operational problems.
- Securing the exhaust can be done with “p” clamps like the ones provided in our standard installation kits.

⚠️ CAUTION!
Run exhaust so that it cannot be plugged by dirt, water or snow. Ensure the outlet does not face into the vehicle slip stream. Lay the exhaust system so that the outflowing exhaust gases are not sucked in as combustion air.

The exhaust is hot, keep a minimum of 5cm (2”) clearance from any heat sensitive material.
Route exhaust so that the exhaust fumes cannot enter the passenger compartment.

Every type of combustion produces high temperatures and toxic exhaust fumes. This is why the exhaust system must be routed according to these installation instructions.
- Do not perform any work on the exhaust system while the heater is working.
- Before working on the exhaust system, switch off the heater first and wait until all the parts have completely cooled down, wear safety gloves if necessary.
- Do not inhale exhaust fumes.

Ensure exhaust pipe ends in open air. Mount the exhaust pipe with sufficient clearance to heat-sensitive parts. Pay particular attention to fuel pipes (made of plastic or metal), electrical cables and brake hoses, etc.

---

1 Heater
2 Combustion air hose
3 Flexible exhaust pipe
4 Exhaust silencer
5 Exhaust pipe end with end sleeve
6 Spacer ring
4 INSTALLATION PROCEDURES

INTAKE CONNECTION
The combustion air must be drawn out of an area which does not become hotter than 25°C (77°F) and in which neither spray water or dust / dirt are to be expected.
The Ø 20 mm flexible combustion air hose must be secured to the heater with a hose clamp (tightening torque 3+0.5 Nm - 2.2 ft-lb)

⚠️ CAUTION!
➤ The combustion air opening must be free at all times.
➤ Lay the combustion air intake to ensure that exhaust fumes cannot be sucked in as combustion air.
➤ Arrange the combustion air intake so that it is not directed against the slipstream of the vehicle.
➤ The combustion air intake must not become clogged with dirt and snow.
➤ Install the combustion air intake system sloping slightly downwards. If necessary, make a drain hole approx. Ø 5 mm (3/16") at the lowest point to drain off condensation.
4 INSTALLATION PROCEDURES

ELECTRICAL CONNECTIONS

All parts needed are included with all standard installation kits.

A. Main Heater Harness
   • Connects switch and power harness to the heater harness.

B. Power Harness
   • 2 core harness (red, brown).
   • Connect red wire to fuse link and terminal.
   • Attach ring terminal to vehicle battery (+).
   • Connect brown wire to vehicle battery (–) using ring terminal provided.
   • 20 amp fuse - 12V.

C. Switch Harness
   • 4 core harness (red, brown, yellow, blue/white).
   • Run to location of control option. Make terminal connections at control option.

D. Fuel Metering Pump Harness
   • 2 core harness (green, green) or (green, brown).
   • Connect to fuel metering pump using terminals and protective seals + connector block.

E. Water Pump Harness
   • 2 core harness (black, brown).
   • Connect to main harness at heater.

HYDRONIC HEATER

⚠️ CAUTION!
To avoid potential short circuit damage during installation, insert 20 amp fuse on power harness after all electrical connections are complete.

PLEASE NOTE!
• Negative battery terminal must always be grounded.
  If a vehicle is equipped with switch on negative battery wire, install additional 20 A fuse in negative wire of heater’s harness.
• All harnesses should be cut to length.
  All exposed electrical connections should be coated with protective grease.
• Wire must be inserted into fuse holder prior to terminating.
5  HEATER OPERATION

OPERATING SWITCHES

EasyStart T

• Manual On / Off of heater.
• Program up to 3 start times, up to 7 days ahead.
• Has ability to read diagnostic fault codes.

Push / Pull Switch

• Manual On / Off of heater.

7-Day Timer

• Manual On / Off of heater.
• Program Start up to 7 days ahead. (not every day of the week)
• Diagnostic not compatible with HII heaters

Mini Timer

• Manual On / Off of heater.
• Program Start up to 24 hours ahead.
• No Diagnostic capability

Programable Timer

• Manual On / Off of heater.
• Program up to 8 start times per day, multiple days of the week.
  (eg. Mon – Fri, Mon – Sun…)
• No Diagnostic capability.

PLEASE NOTE!

DIAGNOSTIC COMPATIBILITY

Only EDITH and EasyStart diagnostic products are compatible with Hydronic II heaters. Older diagnostic products like the 7-day timer, Digi Diagnostic and “Fault code retrieval device” are not compatible.

For more information on these and other control options please visit www.espar.com/help.
5 HEATER OPERATION

HEATER WIRING

CAUTION!

SAFETY INSTRUCTIONS FOR WIRING THE HEATER!
The heater is to be connected up electrically according to the local standards.

- Ensure that the insulation of electrical cables is not damaged.
- Avoid:
  - chafing, kinking, jamming or exposure to heat.
  - Seal empty terminal chambers with filler plugs to ensure they are dirt-proof and water-proof.
  - Electrical connections and ground connections must be free of corrosion and firmly connected.
  - Lubricate connections and ground connections outside the heater interior with contact grease.

PLEASE NOTE!

Comply with the following when wiring the heater and the control unit:

- Electrical leads and components must be positioned in the vehicle so that they can function perfectly under normal operating conditions without impairment (e.g. due to heat exposure, moisture, etc.).
- Ensure that the proper gauge of wire is used for your installation.

PARTS LIST FOR HEATER CIRCUIT DIAGRAM

Parts list for heater circuit diagram

1.1 Burner motor
1.2 Glow plug
1.5 Control - overheating sensor
1.12 Flame sensor
1.13 Surface sensor
2.1 ECU
2.2 Fuel metering pump
2.5.7 Vehicle blower relay
2.7 Main fuse, 20 A
2.7.1 Control fuse, 5 A
2.7.5 Vehicle blower fuse, 25 A
2.12 Water pump
5.1 Battery
b) Vehicle blower connection

PLEASE NOTE!
The relay, 12 volt 2.5.7 (from terminal 30 to terminal 87a) has a maximum power consumption of 40 A; i.e. the value of the vehicle's own blower fuse may not be more than 40 A. For circuit diagram, see page 28.

5 HEATER OPERATION

HEATER CIRCUIT DIAGRAM
5 HEATER OPERATION

PRE-START PROCEDURES

• Check all fuel, electrical and plumbing connections.
• Refill the engine coolant.
• Bleed air from the coolant system by running the engine and refilling the antifreeze as needed. Resecure heater hose.
• Run engine to further bleed the system.
• Top up engine coolant.

START UP / SAFETY FACTORS

Once the heater is switched on, the following sequence occurs:

The water pump starts up, then the combustion air fan, glow plug and metering pump are started.

The time-controlled glow plug is switched off once a stable flame has formed in the combustion chamber.

Depending on the heat requirements, the heater runs at the following levels: Power – High – Low – Standby. The temperature thresholds for these are permanently programmed in the electronic control unit (ECU).

The heater starts in “Power” control stage.
After the coolant temperature has reached approx.
65 °C (149 °F) – depending on the selected blower setting – the heater switches to the "High" control stage.
If the cooling water continues to rise up to 80 °C (176 °F), the heater switches to "Low" control stage.
• If the heat output achieved in “Low” control stage is insufficient, the cooling water temperature drops to 75 °C (167 °F) – the heater switches back to “High” control stage.
• If the heating output in “Low” control stage is inadequate, the cooling water temperature rises to 85 °C (185 °F).
The heater switches to Standby and is followed by an after-run, 90 seconds.
• If the coolant temperature cools to 75 °C (167 °F) during standby, a controlled start occurs in a high control stage.

Safety checks before starting up the heater.
After a lengthy stoppage (summer months), check all components for secure fit (tighten screws where necessary).
Carry out a visual check of the fuel system for leaks.

• The heater is restarted if it does not ignite within 70 seconds.
The heater is automatically shut down if two attempts are made and the heater fails to start within the preset safety period (240 seconds).
After an impermissible number of failed start attempts, the ECU is locked.
• If the flame independently goes out during operation, the heater is restarted and if necessary, a maximum of two further start attempts are made within the preset safety time.
If the heater does not ignite or ignites but goes out again within 15 minutes, a safety time out occurs.
The safety time out can be cancelled by briefly switching off and on again (ignition ON/OFF).
• In the case of overheating (e.g. insufficient coolant flow, air in coolant system), the overheating sensor triggers, the fuel pump is stopped and the heater is automatically shut down. Once the cause of the overheating has been eliminated, the heater can be re-started by switching off and on again (ignition ON/OFF).
The coolant temperature needs to be less then 70 °C (158 °F) in order for the heater to restart.
After an impermissible number of shut-downs on overheating, the ECU is locked.
• If the lower or upper voltage limit is reached, the heater is automatically shut down.
• The heater does not start up if the glow pin is defective or if the electric cable to the metering pump is interrupted.
• The speed of the blower motor is continuously monitored. If the blower motor does not start up, if it is blocked or if the speed falls below 40% of the desired speed, the heater is automatically shut down after 60sec.

PLEASE NOTE!

If the heater fails to start the first time it will automatically attempt a second start. If the second attempt is unsuccessful the heater will shut down completely. On initial start up the heater may require several start attempts to prime the fuel system.

EMERGENCY SHUTDOWN — EMERGENCY OFF
If an emergency shutdown – EMERGENCY OFF – is necessary during operation, proceed as follows:
• Switch the heater off at the control unit or
• remove the fuse or
• disconnect the heater from the battery.
5 HEATER OPERATION

⚠️ CAUTION!
Do not repeat the switching off / on routine more than twice.

⚠️ WARNING!
The heater must be switched off while any fuel tank on the vehicle is being filled.
The heater must not be operated in garages or enclosed areas.

PERIODIC MAINTENANCE
• Check coolant hoses, clamps, and make sure all valves are open. Maintain the engine manufacturers recommended coolant level and ensure that the heater is properly bled after service on or involving the coolant system.
• Visual check of all fuel lines for leaks. If applicable check fuel filter inserts and replace if necessary.
• Visual check of electrical lines and connections for corrosion.
• Run your heater at least once a month during the year (for a minimum of 15 minutes).
• Maintain your batteries and all electrical connections in good condition. With insufficient power the heater will not start. Low and high voltage cutouts will shut the heater down automatically.
• Use fuel suitable for the climate. Blending used engine oil with diesel fuel is not permitted.
• Replacing the glow pin screen and cleaning ventilation hole before the winter season is recommended, for guaranteed start up.
BASIC TROUBLESHOOTING

In the event of failure there are several items which should be checked first before any major troubleshooting is done.

Check:
- Fuses.
- Electrical lines and connections.
- Interference in Combustion air and Exhaust pipes.
- Fuel in the tank.
- Battery voltage on heater side of harness.
- Coolant flow.

SELF DIAGNOSTICS

The heater is equipped with self diagnostic capability. You can retrieve information on the heater’s last 5 faults using the EasyStart diagnostic or ISO adapter and computer (EDiTH).

PLEASE NOTE!

Always connect in the given order!
- The plug-in “diagnosis” connection may not be disconnected until the heater has been switched off and the after-running has finished!
- Check whether version S3V10-F (on newer) of the EDiTH software required for the diagnosis has been installed on the PC, if necessary the latest version can be downloaded from: www.espar.com/help
- Follow the operating instructions for EDiTH diagnostics software.

PLEASE NOTE!

The 7 day timer. FCR and the Digi Diagnostic cannot be used to read diagnostic fault codes from the Hydronic II heaters.
START THE DIAGNOSIS QUERY.

- Double-click the ‹EDITH› icon on the Desktop to start the diagnostic software. The EDITH Start window opens.
- Double-click the ‹flame› button to open the ‹Heaters and test selection› window opens.
  - Select the heater by its ‹Version No.› or via the ‹Automatic search›.
- In the ‹Test› window, double-click ‹General Data +Fault Memory› to open the ‹Fault memory› window.
  - The fault code of the current fault/error is and the fault code of faults/errors F1 – F5 are displayed.

DELETE THE FAULT MEMORY AND AT THE SAME TIME CANCEL THE CONTROL BOX LOCK

- In the "Fault memory" window, press the "Delete fault memory" button in the menu bar.
  - The whole fault memory is deleted and the control box is unlocked.

**FAULT DIAGNOSIS USING THE CONTROL UNIT**

**DIAGNOSIS CAPABLE CONTROL UNIT**

- EasyStart T timer: 22 1000 32 88 00

If faults occur in the heater while it is running, they are displayed with "Err" after the mobile unit or timer has been activated. The current fault and the stored faults "F1" to "F5" can be queried.

**PLEASE NOTE!**

- The blue/white diagnostics cable must be connected in order to perform the diagnosis.
- Fault code, fault description, cause / remedial action are described from page 34.
- Ensure sufficient battery voltage (min. 10.5 volt).

**QUERY / DELETE FAULT MEMORY AND CANCEL THE HEATER LOCK**

Activate mobile unit / timer
(EasyStart T operating instructions)

Confirm symbol with .

Heater is switched on.

Confirm operating time with .

Following activation, the following can be shown in the display (display appears after approx. 20 sec.):

Display if errors/faults exist
Display if no errors/faults exist

The following actions are possible with both displays:

- Display current fault in fault memory.

and at the same time briefly press .

- Display fault memory F1 – F5

or press .

The current fault is always written in fault memory F1.

- Display fault memory again.

or, at the same time, briefly press .

- Delete the fault memory and as a result, at the same time cancel the control box lock.

Confirm current fault or one of the faults F1 – F5 with .

Confirm dEL display again with .

The fault memory is deleted and the control box is unlocked.

- Switch off the heater.

press.
## 6 MAINTENANCE, TROUBLESHOOTING & REPAIRS

| 009                | Air pressure sensor - communication error  | Communication lost between the ECU and air pressure sensor.  
• Read air pressure sensor fault memory (can only be read with EDiTH diagnostic software).  
• Check wiring and connections.  
• If sensor is ok, test ECU. |
| 010                | Overvoltage                                | > 15 volt applied to ECU for at least 20 seconds without interruption  
• Disconnect connectors B1/S1, measure voltage at connector B1 – between pin 1, (red) and pin 2, (brown).  
⇒ Check power source. |
| 011                | Undervoltage                               | < 10.5 volt applied to ECU for at least 20 seconds without interruption  
• Vehicle engine off, disconnect connector B1/S1, measure voltage in connector B1 – between pin 1 (red), and pin 2, (brown).  
⇒ Check the fuses, the supply cables, and connections at the battery for voltage drop (corrosion). |
| 012                | Overheat - overheat sensor level 1         | Temperature at overheating sensor >125 °C  
• Check coolant circuit:  
  – Check water circuit for leaks.  
  – Vent water circuit.  
  – If check if all parts in coolant system are directing flow in the correct direction.  
• Check if flow rate meets specification.  
• Check overheat sensor:  
  – Check wires for continuity, short circuit and damage.  
  – Measure the resistance in connector B2 – between pin 10, (black) and pin 11, (black), see page 46 for measured values.  
⇒ Check water pump, see Fault code 041 and 042. |
| 013 014            | Overheat - threshold temperature difference exceeded. (before FMP starts.) | Temperature values of the overheating sensor and the surface sensor is too large.  
• For remedial action see Fault code 012.  
• Check the surface sensor:  
  – Check wiring for continuity, short circuit and damage.  
  – Measure the resistance in connector B2 – between pin 7, (black) and pin 8, (black), see page 47 for measured values. |
| 015                | ECU lockout - too many overheats           | The ECU is locked due to consecutive overheating (Fault code 012, 013, 014, 016).  
• For remedial action see Fault code 013.  
• Unlock ECU, see from pages 32 - 33. |

**PLEASE NOTE!**  
Fault code 014 is only displayed if the heater is running and the water temperature at the overheating sensor has reached at least 80 °C.

- Check the diagnostics cable:  
  Connector B1 – pin 5 and connector S8 – pin 2, check blue/white wire for continuity, short circuit and damage, if ok ⇔ test ECU, see Fault code 90. |
## 6 MAINTENANCE, TROUBLESHOOTING & REPAIRS

<table>
<thead>
<tr>
<th>FAULT CODE DISPLAY</th>
<th>FAULT DESCRIPTION</th>
<th>INFORMATION</th>
</tr>
</thead>
</table>
| 030                | Blower speed out of range | Impeller blocked (frozen, soiled, sluggish, ...)
  - Remove blockage and manually turn the impeller to check if it spins smoothly.
  - Measure the speed using a non-contact r.p.m. counter, see page 48.
  - Disconnect connector B2 – apply power (+, red) to pin 13 (black) and apply ground (-, brown) to pin 14 (brown), use 8.2 volt (+ 0.2 volt).
  - Speed <10000 rpm ⇒ replace the combustion air fan.
  - Speed > 10000 rpm ⇒ test the ECU.
| 031                | Blower – open circuit | • Check blower wiring:
  - Check connector B2 – pin 13 (black) and pin 14 (brown) for continuity, short circuit and damage.
  - Perform the speed measurement, see Fault code 30.
| 032                | Blower – short circuit |  
| 035                | Blower – transistor error |  
  - CAUTION!
  - The motor is irreparably damaged if the voltage values are exceeded.
  ⇒ Perform the functional check with max. 8.2 volt.
| 038                | Vehicle blower – open circuit | • Check vehicle blower harness:
  - Check connector B1 – pin 3, (black/red) and pin 2, (brown) for continuity, short circuit and damage.
| 039                | Vehicle blower – short circuit |  
| 040                | Vehicle Blower - transistor error | Remove relay, if fault code 38 is displayed, the relay is defective. ⇒ Replace relay.
| 041                | Water pump - open circuit | • Check water pump harness:
  - Check connector B1 – pin 8, (purple) and pin 9, (brown) for continuity, short circuit and damage.
| 042                | Water pump - short circuit |  
| 043                | Water pump - transistor error | Disconnect connector at water pump, if fault code 041 is displayed, the water pump is defective. ⇒ Replace water pump.
| 047                | Fuel pump - short circuit | • Check FMP harness:
  - Check connector B1 – pin 4, (green) and pin 10, (brown) for continuity, short circuit and damage.
| 048                | Fuel pump - open circuit |  
| 049                | Fuel pump - transistor error | Disconnect harness from FMP, if Fault code 048 is displayed the FMP is defective replace the metering pump.

| 092 - 099          |                            |                                                                             |
The permitted repair work to the heater is described in the "Repair Instructions" chapter. The heater must be removed from the vehicle for the repair work to be carried out. The heater is assembled in the reverse order, note and follow any additional instructions.

**PLEASE NOTE!**
After completing all the work and installing the heater in the vehicle, perform a functional check on the heater.

**BEFORE WORKING ON THE HEATER, ALWAYS FOLLOW THE RELEVANT SAFETY INSTRUCTIONS.**

**DANGER!**
Risk of injury, burns and poisoning!
- Always switch off the heater beforehand and leave it to cool.
- Disconnect the battery.
- The heater must not be operated in closed rooms such as garages or workshops.
  Exception:
  Exhaust suction available directly at the entry to the exhaust pipe.

**CAUTION!**
- The seals of dismantled components must be replaced.
- During repair work, check all components for damage and if necessary replace.
- Check connector contacts, plug-in connections and cables for corrosion and damage and if necessary repair.
- Only use original spare parts if replacements are necessary.
- After working on the coolant circuit the level of the coolant must be checked and if necessary topped up according to the vehicle manufacturer's instructions.
- The coolant circuit must then be vented.
- Operation or the after running of the heater may only be stopped in an emergency (see "EMERGENCY SHUT DOWN" Page 5) by interrupting the battery current (risk of heater overheating).

**SPECIAL TOOL**
**AMP RELEASE TOOL**
The AMP release tool is used to release plug-in contacts in a connector housing.
This release tool can be ordered directly from AMP.

- For standard timer,

REPAIR STEPS

PLEASE NOTE!
This repair instruction describes how to dismantle the heater in individual repair steps. Reference is made to the necessary preceding steps to be performed at the relevant repair steps.

Repair step 1
Remove “ECU” cover Page 43

Repair step 2
Remove "blower" cover Page 43

Repair step 3
Remove hose fittings from the “ECU” cover Page 44

Repair step 4
Dismantling the “ECU” Page 45

Repair step 5
Remove overheating sensor and surface sensor Page 46
Check overheat sensor Page 46
Check the surface sensor Page 47

Repair step 6
Remove "blower motor" cover and "Blower assembly with combustion chamber" Page 49

Repair step 7
Measure blower speed Page 49

Repair step 8
Remove flame sensor Page 50
Check flame sensor Page 50

Repair step 9
Check glow plug Page 51
Dismantle glow plug Page 51

CONNECTOR ASSIGNMENT – 10-PIN CONNECTOR S1
- Battery ground (-) - brown
- FMP (+) - green
- Add heater signal
- Water pump (+) - purple
- FMP (-) - brown / green
- Water pump (-) - brown
- Heater on wire - yellow
- Diagnostic wire - blue / white
- Vehicle blower - black/red
- Battery plus (+) - red

CONNECTOR ASSIGNMENT – 14-PIN CONNECTOR B2
- Flame sensor - brown
- Glow pin - brown
- Surface sensor - white
- Overheat sensor - black
- Blower motor - black
- Blower motor - brown
- Overheat sensor - white
- Surface sensor - white
- Glow pin - white
- Flame sensor - brown

Connector housings are shown from the cable inlet side.
**6 MAINTENANCE, TROUBLESHOOTING & REPAIRS**

**DISMANTLE THE HEATER**

**STEP 1**

**REMOVE ECU COVER**
- Remove 4 screws M4 x 16 (1) from the ECU cover.
- Unlock cover of ECU cable by turning in direction of arrow (A) pull the ECU cover from the top.
- Keep the ECU cable cover in a safe place for the assembly.
- If an angle connector has been installed, mark the setting.
- Lift ECU cover and carefully pull the water connection socket out of the jacket.
- Remove ECU cover.

1 Fixing screws M4 x 16  
2 ECU cable cover  
3 ECU cover  

**PLEASE NOTE!**

Notes for the assembly:
- Before installing the ECU cover, ensure that the toothed rings of both connection sockets are correctly locked in the cover.
- Insert the ECU cable cover in the ECU cover.
- Screw Torque M4 x 16 = 2.9+0.3 Nm ~ 2.1 ft-lb

**STEP 2**

**REMOVE BLOWER COVER**
To dismantle the blower cover, perform Step 1 first.
- Remove 4 M4 x 16 (1) from the blower cover.
- Remove the blower cover, taking care not to damage fuel connection.

1 M4 x 16 screw  
2 Fuel pipe  
3 Fuel pipe grommet in the blower cover  
4 Blower cover  

**PLEASE NOTE!**

NOTES FOR THE ASSEMBLY:
- Replace the fuel grommet in the blower cover.
- Carefully position the blower cover above the fuel connection on the blower housing, do not clamp the cable between the cover and housing.
- Ensure the fuel connection grommet fits correctly in the blower cover.
- Ensure the blower motor cable grommet fits correctly in the blower housing.

1 Blower motor cable loom Grommet  
- Torque M4 x 16 screws 2.9+0.3 Nm ~ 2.1ft-lb.
STEP 3

REMOVE COOLANT PORTS FROM THE ECU COVER
To dismantle the coolant ports from the ECU cover, perform Step 1 first.
• Push the coolant port down into the ECU cover.
• Loosen toothed ring.
• Remove O-ring.
• Pull the coolant ports from the ECU cover from above.

PLEASE NOTE!
NOTES FOR THE ASSEMBLY:
• Insert the coolant port in the ECU cover from above.
• Insert O-ring in the groove of the coolant port.
• Fit the toothed ring onto the coolant port and insert in the ring gear of the ECU cover. If an angled connection socket was fitted, the angled coolant port must be aligned according to the installation position or the marking and inserted in the gear ring of the ECU cover.
STEP 4

DISMANTLING THE ECU

To dismantle the ECU, perform Step 1 first.

• Unlock the locking tab at the 14-pin connector (B2) by turning in direction of arrow (A).
• Pull off the 14-pin connector (B2) from above.

1 14-pin connector (B2)
2 Locking tab

• Undo fixing screw M4 x 12 compression spring overheating sensor / control box. Remove the compression spring.

1 M4 x 12 screw

• Remove the ECU.

PLEASE NOTE!

The overheat sensor does not have to be removed.
Torque M4 x 12 screws 3.3+0.3 Nm ~ 2.5 ft-lb.
6 MAINTENANCE, TROUBLESHOOTING & REPAIRS

**STEP 5**

REMOVE OVERHEAT SENSOR AND SURFACE SENSOR
To remove the overheat / Surface sensor, perform Step 1 and Repair Step 4 first.
- Use long nose pliers to pull the overheat sensor out of the locator hole in the jacket. Remove overheat / surface sensor and the 14-pin connector (B2).

![Image of overheat sensor components]

1 Overheat sensor
2 Surface sensor
3 14-pin connector (B2)

**PLEASE NOTE!**
The overheat / surface sensor and 14-pin connector are a sub-assembly and are not available as individual parts.
- If replacing the overheat / surface sensor and 14-pin connector (B2) consult page 42. for proper pinning.

**PLEASE NOTE!**
Notes for the assembly:
- When installing, twist the overheating sensor lead harness and the surface sensor lead harness.

**CHECK OVERHEAT SENSOR**
- Check the overheat sensor using a digital multimeter in the 14-pin connector (B2) at pin 10 and 11. If the resistance value lies outside the diagram or the table of values, replace the overheat sensor.

![Image of digital multimeter and overheat sensor]

**Graph:**
- X-axis: Temperature (°C)
- Y-axis: Resistance (kΩ)

- Resistance values decrease as temperature increases.

**CHECK THE SURFACE SENSOR**

- Check the surface sensor using a digital multimeter in the 14-pin connector (B2) at pin 7 and 8. If the resistance value lies outside the diagram or the table of values, replace the surface sensor.

1. Surface sensor
2. 14-pin connector (B2)
3. Digital multimeter
6 MAINTENANCE, TROUBLESHOOTING & REPAIRS

STEP 6

REMOVE THE BLOWER MOTOR COVER AND BLOWER SUB-ASSEMBLY WITH COMBUSTION CHAMBER

To remove the blower motor cover and blower sub-assembly with combustion chamber, perform Step 1, Step 2 and Step 4 first.

• Remove pins from the blower motor in the 14-pin connector (B2), pin 13 black and pin 14, brown, using the AMP release tool.
• Remove pin from the flame sensor in the 14-pin connector (B2), pin 1, brown and pin 2, brown using the AMP release tool.
• Remove pins from the glow pin in the 14-pin connector (B2), pin 3, brown and pin 6, black using the AMP release tool.

1 14-pin connector (B2)

• Remove 4 x M5 x 80 screws of the blower motor cover and the blower.

1 M5 x 80 screw.

• Remove blower motor cover.
• Pull the Blower with combustion chamber sub-assembly out of the heat exchanger.

1 1 Blower motor cover
2 2 Blower with combustion chamber sub-assembly

• Remove the combustion chamber from the blower housing, at the same time pull off the grommet from the glow pin and the grommet from the fuel tube from the blower housing together with the combustion chamber.

1 1 Fuel pipe grommet
 1 2 Glow pin wiring grommet
 1 3 Combustion chamber
 1 4 Blower housing with flame sensor
6 MAINTENANCE, TROUBLESHOOTING & REPAIRS

REMOVE THE ELECTRIC MOTOR COVER AND BLOWER SUB-ASSEMBLY WITH COMBUSTION CHAMBER

- Remove seal between the combustion chamber flange and the blower housing or between the combustion chamber flange and the heat exchanger, carefully clean all sealing surfaces.
- Pull grommet off the fuel pipe.

⚠️ CAUTION!
Reusing the dismantled seals and grommets can result in leaks and malfunctions in the heater.
→ Use the specified spare parts kit.

1 Grommet, fuel pipe in blower housing  
2 Grommet, glow plug in blower housing  
3 Seal, combustion chamber flange / blower housing

### PLEASE NOTE!
NOTES FOR THE ASSEMBLY:
- Position new seal between the blower housing and combustion chamber on the combustion chamber flange, note the different cutouts in the seal.
- Position the glow pin wiring grommet with its flat surface on the seal (combustion chamber flange).
- Push on the grommet for the fuel pipe and position on the seal (combustion chamber flange).
- When assembling the combustion chamber and blower housing, always ensure the grommets sit properly.
- Insert new seal between the combustion chamber and the heat exchanger, in the circular recess of the jacket and heat exchanger.
- Tightening torque of the fixing screws: M5 x 80 = 6.5±0.5 Nm ≈ 4.8 ft-lb.

### STEP 7

MEASURE BLOWER SPEED
To measure the blower speed, perform Repair step 1, 2 and 4 first.
- Apply a marking (white paint) to the impeller and measure the speed using a non-contact r.p.m. counter.
- Apply max. 8.2 V at the 14-pin connector (B2), pin 13 black and pin 14 brown.
- If the measured speed <10 000 rpm, then replace the blower.
- If the measured speed > 10 000 rpm, then test the ECU.

1 14-pin connector (B2)  
2 Marking
STEP 8

REMOVE FLAME SENSOR
To remove the flame sensor, perform Repair step 1, Repair step 2 and Repair step 4 and Repair step 6 first.
• Pull the flame sensor wiring loom grommet out of the groove.
• Pull out the flame sensor together with the grommet (graphite grommet) from the groove in the blower housing.
• Remove the flame sensor.

PLEASE NOTE!

NOTES FOR THE INSTALLATION
• The relevant rules of sound engineering practice and any information provided by the vehicle manufacturer are to be observed during the installation and repair.
• When carrying out electric welding on the vehicle, the positive cable at the battery should be disconnected and placed at ground to protect the ECU.

CHECK FLAME SENSOR
Check the flame sensor using a digital multimeter. If the resistance value of the flame sensor lies outside the diagram or the table of values, replace the flame sensor.

TABLE OF VALUES

PLEASE NOTE!

NOTES FOR THE INSTALLATION
• The relevant rules of sound engineering practice and any information provided by the vehicle manufacturer are to be observed during the installation and repair.
• When carrying out electric welding on the vehicle, the positive cable at the battery should be disconnected and placed at ground to protect the ECU.
CHECK GLOW PIN
To check the glow pin, perform Repair step 1 and 2 first.
• Unlock the locking tab at the 14-pin connector (B2) by turning in direction of arrow (A).
• Pull off the 14-pin connector (B2) from above.

1 14-pin connector (B2)  
2 Locking tab

DISMANTLE GLOW PIN
To remove the glow pin, perform Repair step 1, 2 and 6 first.
• Carefully pull the glow pin out of the combustion chamber and replace.

1 Glow pin grommet  
2 Glow pin

PLEASE NOTE!
NOTES FOR THE ASSEMBLY:
• The following parts are included in the spare parts kit and must be used:
  – Grommet, fuel pipe
  – Grommet, fuel pipe in the "blower" cover
  – Grommet, flame sensor (graphite grommet)
  – Seal, between the combustion chamber flange and the blower housing
  – Seal, between the combustion chamber flange and the heat exchanger
MEASURING THE FUEL QUANTITY WITHOUT EDIT

PREPARING FOR THE MEASUREMENT
• Remove the fuel line from the heater and insert a measuring cylinder (size 25 ml).
• Switch on heater.
• Depending on the heater type, the metering pump starts pumping fuel after 17 to 20 sec. Ensure that the fuel line is filled with fuel and free of bubbles. At this point you are ready to perform the test.
• Switch off heater, empty measuring cylinder and insert the fuel line in to the cylinder.
• Switch on heater.
• Depending on the heater type, the metering pump starts pumping fuel after 17 to 20 sec.
• During the measurement, hold the measuring cylinder at the level of the heater.
• Gasoline heaters
  – For gasoline heaters, because of the delivery rate, it is sufficient to start once to measure the fuel quantity.
• Diesel heaters
  – In the case of diesel heaters, after starting once, two automatic start repeats must take place to obtain sufficient fuel for the measurement.
• After measuring, switch off the heater.
• Read off the quantity of fuel in the measuring cylinder.
EVALUATION

- Compare the measured quantity of fuel with the values in the following table.
  If the measured quantity of fuel is above the maximum value or below the minimum value, the metering pump must be replaced.

<table>
<thead>
<tr>
<th>Heater type</th>
<th>Hydronic II</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delivery period in sec.</td>
<td>B 5 S</td>
</tr>
<tr>
<td>(one-off start)</td>
<td>80 sec</td>
</tr>
<tr>
<td>(one start + two repeats)</td>
<td></td>
</tr>
<tr>
<td>Fuel quantity – nominal. [ml]</td>
<td>12.4</td>
</tr>
<tr>
<td>Fuel quantity – max. [ml]</td>
<td>13.7</td>
</tr>
<tr>
<td>Fuel quantity – min. [ml]</td>
<td>11.2</td>
</tr>
</tbody>
</table>

PLEASE NOTE!

Only carry out the fuel measurement if the battery is sufficiently charged. During the measurement at least 12 volt or max. 13 volt should be applied to the heater.

FUEL QUANTITY TEST WITH EDITH

- Remove the fuel line at the heater and insert a measuring into cylinder (size 25 ml).
- Connect heater to EDITH (ISO adapter) and select "switch on component" function at the PC.
- Select "metering pump" component, click "Run" button and pump fuel into the measuring cylinder.
  Retain setting of 30 sec. delivery period with 10 Hz metering pump frequency.
- After 30 sec. the metering pump switches off, empty the measuring cylinder.

MEASUREMENT / EVALUATION

- Switch on the "metering pump" component again via EDITH and pump into the measuring cylinder, delivery period 30 sec. with 10 Hz metering pump frequency.
- After 30 sec. the metering pump is switched off, read off the quantity of fuel in the measuring cylinder.
